Integration by parts is a special technique of integration of two functions when they are multiplied. This method is also termed as partial integration. Another method to integrate a given function is integration by substitution method. These methods are used to make complicated integrations easy.

Integration by Parts - Formula, ILATE Rule & Solved Examples

In mathematics, integration by parts is a special method of integration when two functions are multiplied together. This method is used when the integrals are difficult to evaluate. In this method, the integration by parts formula moves the product out of the equation, so that the integral can be evaluated easily.

Having the parts required for a product show up where they are needed, when they are needed, helps to not only prevent delays in the manufacturing process, but also eliminates a lot of wasted time, storage space, and more. When done properly, supply chain integration will bring parties that are often at odds together with a single focus.
