### **Andrey Markov - Wikipedia**

In probability theory, a Markov model is a stochastic model used to model randomly changing systems. It is assumed that future states depend only on the current state, not on the events that occurred before it. Generally, this assumption enables reasoning and computation with the model that would otherwise be intractable. For this reason, in the fields of predictive modelling and probabilistic forecasting, it is desirable for a given model to exhibit the Markov property.

Markovian processes A stochastic process is called Markovian (after the Russian mathematician Andrey Andreyevich Markov) if at any time  $t$  the conditional probability of an arbitrary future event given the entire past of the process—i.e., given  $X(s)$  for all  $s \leq t$ —equals the conditional probability of that future event given only  $X(t)$ .
