Chronic kidney disease (CKD) affects more than 10% of the world population. The final common pathway of kidney injury is fibrosis and its extent is inextricably linked to clinical outcomes. 1,2 No approved therapies exist and the cellular origin, functional heterogeneity and regulation of scar-producing cells in the human kidney continues to be debated. 1,2 Using single cell (sc)RNASeq, we ...

The scarring of liver fibrosis can interfere with the liver's ability to work efficiently. However, fibrosis itself doesn't cause any symptoms. You can have liver fibrosis and not know it. Fortunately, doctors can find signs of liver fibrosis with blood tests called liver function tests (LFTs). Most people get LFTs for routine physical exams.

Pulmonary fibrosis is a lung disease that occurs when lung tissue becomes damaged and scarred. This thickened, stiff tissue makes it more difficult for your lungs to work properly. As pulmonary fibrosis worsens, you become progressively more short of breath. The scarring associated with pulmonary fibrosis can be caused by a multitude of factors.

Most patients with chronic infection develop liver fibrosis, which varies from early stages in which the liver begins with fibrosis, to what experts call liver cirrhosis (stage 4), which correlates with massive damage to the liver and the loss of its functionality. Different variants have been attributed to this degree of variability.

Tumors are abnormal growths of cells. Tumors affecting the skin or the tissue just under the skin are the most commonly seen tumors in cats. This is partly because they are the most easily seen tumors and partly because the skin is constantly exposed to many tumor-causing factors in the environment.
