Plant pathogens, with a couple of minor exceptions, are microorganisms that belong to the same taxonomic groups, that is, bacteria, viruses, fungi, protozoa, and nematodes, which include the pathogens that cause disease in humans and animals. Each species of plants appears to be attacked by about 100 kinds of pathogens.

PRINCIPLES OF PLANT PATHOLOGY - Hill Agric

Vegetative propagating material free of pathogens that are distributed systemically throughout the plant (viruses, viroids, mollicutes, fastidious bacteria, and some wilt-inducing fungi and bacteria) is obtained from mother plants that had been tested and shown to be free of the particular pathogen or pathogens.

Principles & Methods of Plant Disease Control : Plantlet

Plant disease resistance is the ability of a plant to prevent and terminate infections from plant pathogens. Structures that help plants prevent disease are: cuticular layer, cell walls and stomata guard cells. These act as a barrier to prevent pathogens from entering the plant host. Once diseases have overcome these barriers, plant receptors initiate signalling pathways to create molecules to compete against the foreign molecules.

Introduction to Plant Disease - USDA ARS

The first principle (prevention) includes disease management tactics applied before infection (i.e., the plant is protected from disease), the second principle (therapy or curative action) functions with any measure applied after the plant is infected (i.e., the plant is treated for the disease).

Plant Disease Management

Collectively, fungi and FLOs cause the most plant disease than any other group of plant pathogens. These organisms cannot make their own food, lack chlorophyll, have filamentous growth, and may or may not reproduce by spores. Fungi and FLOs are able to overwinter in soil or on plant debris.

- Infectious plant diseases are caused by living organisms that attack and obtain their nutrition from the plant they infect. The parasitic organism that causes a disease is a pathogen. Numerous fungi, bacteria, viruses, and nematodes are pathogens of corn and soybean in Iowa.

Introduction to Plant Pathology

The most common plant pathogens are fungi, bacteria, mollicutes, parasitic higher plants, parasitic green algae, nematodes, protozoa, viruses, and viroids. These parasites cause serious plant diseases, because they have the ability to penetrate the plant tissues to feed and proliferate in it, and withstand the conditions in which the host lives.

In the case of plant pathogens, however, there are two distinctions from biological control of organisms such as insects and plants. First, management occurs at the microbial level, typically in biological microcosms (leaf surfaces, fruit surfaces, etc.) (Andrews, 1992). Second, biological control agents include competitors as well as parasites.
