The syntax of textual programming languages is usually defined using a combination of regular expressions (for lexical structure) and Backus-Naur form (for grammatical structure) to inductively specify syntactic categories (nonterminals) and terminal symbols. Syntactic categories are defined by rules called productions, which specify the values that belong to a particular syntactic category.

Its syntax is described in Section 13.2.10.2, “JOIN Clause”. SELECT supports explicit partition selection using the PARTITION clause with a list of partitions or subpartitions (or both) following the name of the table in a table_reference (see Section 13.2.10.2, “JOIN Clause”). In this case, rows are selected only from the partitions ...
