aneurysm repair (EVAR), is a type of minimally-invasive endovascular surgery used to treat pathology of the aorta, most commonly an abdominal aortic aneurysm (AAA). When used to treat thoracic aortic disease, the procedure is then specifically termed TEVAR for "thoracic endovascular aortic/aneurysm repair." The procedure

Endovascular repair of aneurysms does not require a large incision and has a substantially shorter recovery than the conventional open surgical approach.

However, not all aneurysms are suitable for endovascular repair. The surgeon first inserts a catheter into an artery in the groin (upper thigh) and threads it to the aneurysm.

conditions, there is good news. Many vascular conditions are quite manageable, if you see a physician early. Vascular surgery and procedures are improving all the time, and sometimes no surgery is necessary. For example, in the early stages of peripheral arterial disease, the prescription is just to take regular walks.
